

## Cisco Aironet Wireless Access Points

As WLAN deployments expand, security, scalability, reliability, ease of deployment, and management become increasingly important. Cisco provides a comprehensive line of access points that deliver enterprise-class features for business-ready wireless LANs.

### Executive Summary

Access points are critical elements of the Cisco® Unified Wireless Network. Cisco single- and dual-band access points are designed for offices and similar environments, challenging RF environments, and the outdoors. The devices are available in two versions: unified or autonomous. Unified access points operate with the Lightweight Access Point Protocol (LWAPP) and work in conjunction with Cisco wireless LAN controllers and the Wireless Control System (WCS). Autonomous access points are based on Cisco IOS® Software and may optionally operate with the CiscoWorks Wireless LAN Solution Engine (WLSE). Autonomous access points, along with the WLSE, deliver a core set of features and may be field-upgraded to take advantage of the full benefits of the Cisco Unified Wireless Network as requirements evolve.

To make the best choices for their particular applications, customers need to understand the features and benefits of the different Cisco Aironet® access points. This solution overview details the capabilities of each of the devices in the Cisco Aironet Family of wireless access points.

### Management Paradigm

As wireless LANs become increasingly mission-critical and evolve in terms of scale and capabilities, the way the wireless deployment is managed must evolve as well. Because each customer and each deployment is unique, Cisco provides differing feature sets and differing management paradigms to address these customer-specific requirements.

Cisco provides a core feature set that includes autonomous access points and the CiscoWorks WLSE management appliance. The core feature set provides a base set of capabilities that are required for enterprise deployments. Core features include secure connectivity through support for 802.11i Wi-Fi Protected Access 2 (WPA2), fast and secure Layer 2 roaming, and interfaces to a variety of third-party applications and products. Most Cisco access points are available in versions designed for autonomous operation. These devices may be upgraded in the field to lightweight mode, thereby providing customers with a smooth path from core to unified features.

The Cisco unified feature set is delivered by lightweight access points, wireless LAN controllers, and the Wireless Control System (WCS) management solution. The unified feature set represents the most comprehensive set of capabilities in the industry, including guest access, wireless intrusion detection and intrusion prevention, scalable Layer 3 mobility, and location services. Most Cisco Aironet access points are available in versions designed for lightweight operation.

## Deployment Environments

Wireless LANs are becoming commonplace in numerous environments, including offices, schools, factories, warehouses, and even the outdoors. At the same time, the wireless industry is evolving from lower-capacity, single-band devices to high-capacity, dual-band solutions. The Cisco Aironet Family of access points meets these various application requirements by providing:

- Single- and dual-band access points
- Devices designed for indoor and outdoor deployments
- A consistent hardware feature set and predictable RF performance for deployment across the enterprise

As WLAN deployment expands into more applications and installation scenarios, a diverse line of access points is required to meet the associated capacity, coverage, and environmental requirements. The Cisco product line includes access points designed for offices and similar facilities, such as hospitals and retail environments, challenging RF environments like factories and warehouses, and the outdoors. These devices can be installed on desktops, on walls, on ceilings, above ceilings, and on top of poles.

While application requirements may vary, Cisco understands that all enterprise customers require uncompromised network security, scalable manageability, and an evolving set of network services. That's why all Cisco Aironet access points support the Cisco Unified Wireless Network, a framework for wired and wireless integration that delivers the security, manageability, and services that enterprises have come to expect from Cisco on both wired and wireless networks.

## Solution

### Addressing Feature Requirements

As wireless LAN usage has evolved from basic transport for largely transactional applications, so have the feature expectations of wireless LAN users and administrators. This change has come about on a segment-by-segment, customer-by-customer basis. It is critical for Cisco to provide differing feature sets to best fit differing customer requirements. Given that customer requirements can evolve during the lifetime of a wireless LAN deployment, it is also necessary to provide a means of smoothly upgrading this feature set for the installed base of products, with minimal disruption to network operations.

Cisco's unified wireless LAN feature set offers the features required for most enterprise deployments. Some deployments may not yet require these advanced capabilities. To address these evolving requirements, customers can select lightweight access points, or they can upgrade autonomous access points in the field to lightweight operation. With Cisco, customers can choose the feature set that is right for them, at the time that it is right for them. Table 1 provides a summary of the operational capabilities of various Cisco Aironet access points.

**Table 1.** Operational Capabilities of Cisco Aironet Access Points

Cisco Series	Autonomous Operation	Lightweight Operation
1100 Series	Yes	Yes
1130AG Series	Yes	Yes
1200 Series	Yes	Yes
1230AG Series	Yes	Yes
1240AG Series	Yes	Yes
1250 Series	Yes	Yes
1300 Series	Yes	Yes
1500 Series	No	Yes

### Addressing Capacity Requirements

In just a few years, WLANs have evolved from proprietary systems with sub-Mbps capabilities to standardized offerings operating at data rates as high as 600 Mbps for dual-band 802.11n access points. These high data rates are available by taking advantage of the emerging 802.11n draft 2.0 standard with radios operating in both the 2.4 GHz band and the 5 GHz band. 802.11n draft 2.0 offers backward compatibility with 802.11a/b/g devices. Both 802.11b/g and 802.11n draft 2.0 are limited to three nonoverlapping channels when deployed in the 2.4 GHz band. 802.11a and 802.11n draft 2.0 support as many as 23 channels in the 5 GHz band (depending upon local regulations). To provide both backward compatibility and high capacity, WLAN client vendors are migrating to 802.11n-capable client devices, although many devices will continue to support the 802.11a/b/g standards and the 802.11n support complete backwards compatibility to ensure investment protection.

Deploying an infrastructure that takes full advantage of next generation wireless with 802.11n makes sense if capacity or reliability is currently an issue or is expected to become an issue during the useful life of the infrastructure devices. Given the rapid expansion of wireless-enabled devices, increasing capacity requirements are likely to apply to most WLAN installations. For this majority of applications, access points that support the emerging 802.11n draft 2.0 standard represents a better long-term value, particularly given the low price premium relative to performance. For the few applications that are not expected to present capacity issues in the near term, customers can choose existing 802.11a/g dual-radio access points. Table 2 summarizes which Cisco access points support 802.11a, 802.11b, 802.11g, and the new 802.11n draft 2.0 standard.

**Table 2.** Cisco Aironet Access Point Support for 802.11a/b/g and 802.11n draft 2.0

Cisco Series	802.11b	802.11g	802.11a	802.11n Draft 2.0
1100 Series	Yes	Yes	No	No
1130AG Series	Yes	Yes	Yes	No
1200 Series	Yes	Yes	Optional <sup>1</sup>	No

<sup>1</sup> With a hardware upgrade module, Cisco Aironet 1200 Series Access Points may be field-upgraded to support 802.11a.

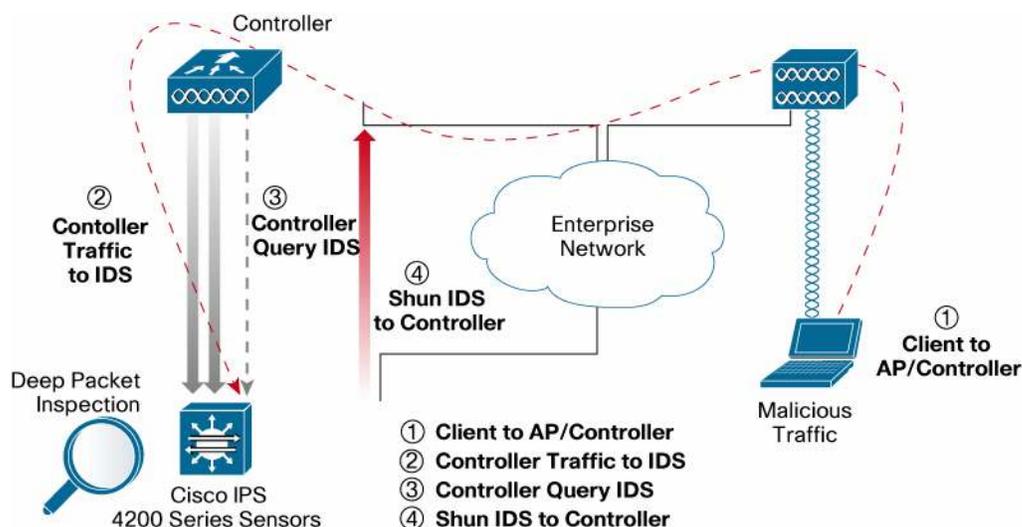

Cisco Series	802.11b	802.11g	802.11a	802.11n Draft 2.0
1230AG Series	Yes	Yes	Yes	No
1240AG Series	Yes	Yes	Yes	No
1250 Series	Yes	Yes	Yes	Yes
1300 Series	Yes	Yes	No	No
1500 Series	Yes	Yes	Yes	No

## Award-Winning Security

The Cisco Aironet Series access points supports 802.11i, Wi-Fi Protected Access (WPA), WPA2, and numerous Extensible Authentication Protocol (EAP) types. WPA and WPA2 are the Wi-Fi Alliance certifications for interoperable, standards-based WLAN security. These certifications support IEEE 802.1X for user-based authentication, Temporal Key Integrity Protocol (TKIP) for WPA encryption, and Advanced Encryption Standard (AES) for WPA2 encryption. These certifications help to ensure interoperability between Wi-Fi-certified WLAN devices from different manufacturers.

Cisco Aironet Series Access Points operating with LWAPP support Cisco Unified Intrusion Detection System/Intrusion Prevention System (IDS/IPS), a software feature that is part of the Cisco Self-Defending Network and is the industry's first integrated wired and wireless security solution. Cisco Unified IDS/IPS (Figure 1) takes a comprehensive approach to security—at the wireless edge, wired edge, WAN edge, and through the data center. When an associated client sends malicious traffic through the Cisco Unified Wireless Network, a Cisco wired IDS device detects the attack and sends shun requests to Cisco wireless LAN controllers, which will then disassociate the client device.

**Figure 1.** Cisco Unified IDS/IPS Detects Malicious Attacks Allowing the WLAN Controller to Disassociate the Offending Client Device

Autonomous or unified Cisco Aironet Series access points support management frame protection for the authentication of 802.11 management frames by the wireless network infrastructure. This allows the network to detect spoofed frames from access points or malicious users impersonating infrastructure access points. If an access point detects a malicious attack, an incident will be generated by the access point and reports will be gathered on the Cisco wireless LAN controller, Cisco WCS, or CiscoWorks WLSE.

- Supported only on Cisco Aironet 1240AG and 1130AG Series Access Points.
- 8 advertised WLANs/SSIDs that terminate on a Controller or bridged locally.
- Locally bridged WLAN/SSID can be mapped to a VLAN.
- There is support for NAC/Web Auth/802.1x/802.11i on a per WLAN/SSID basis. These protocols are handled centrally, and subsequently the traffic can be bridged locally or continue to be tunneled back to the controller.
- If an AP has never joined a Controller, it can be primed with an IP address, subnet mask, default gateway, and IP address of a Controller. After the AP has contacted the Controller the console is no longer available.
- Cisco recommends that only two Hybrid REAPs be used in any one location over a WAN connection. This configuration is recommended because of the WAN bandwidth required.

### Link Role Flexibility

The autonomous versions of the Cisco Aironet 1300 Series, 1240AG Series, 1230AG Series, and the 1200 Series offer link role flexibility, which provides both access point and bridge functions through configuration of each radio as an access point, repeater, root bridge, non-root bridge, or workgroup bridge. This configuration flexibility enables the access points to address a wide range of applications, including basic wireless LAN coverage, wireless LAN coverage with wireless backhaul, and more traditional bridging applications (Table 3).

**Table 3.** Wireless LAN Link Role Flexibility Applications for Dual-Band Access Points

Radio 1(802.11g or 802.11a)	Radio 2 (802.11g or 802.11a)	RJ-45 State
Root Bridge (RB)	Root bridge, non-root bridge, access point, or workgroup bridge	Uplink
Non-root Bridge (NRB)	Root bridge, non-root bridge, access point, or workgroup bridge	Uplink
Workgroup Bridge (WGB)	Root bridge, non-root bridge, or access point	Uplink
Access Point (AP)	Root bridge, non-root bridge, access point, or workgroup bridge	Uplink
Repeater	Root bridge, non-root bridge, or access point	Downlink

**Note:** Only one 802.11g radio and one 802.11a radio are supported.

### Office Access Points

#### Cisco Aironet 1130AG Series IEEE 802.11a/b/g Access Point

Packages high-capacity, high-security, and enterprise-class features to deliver wireless LAN access for a low total cost of ownership. The device is available in either a lightweight version or an autonomous version that may be field-upgraded to lightweight operation. With support for both lightweight and autonomous operation, customers can enjoy the simplicity and efficiency of a common hardware platform even while having a hybrid lightweight and autonomous deployment. Designed for wireless LAN coverage in offices and similar RF environments, this unobtrusive access point features integrated antennas and dual IEEE 802.11a/g radios for robust and predictable coverage, delivering a combined capacity of 108 Mbps. The product comes complete with all necessary mounting hardware to provide for an installation that is both secure and consistent with contemporary office décor. The mounting bracket locks the access point as well as the Ethernet and console cables in place to prevent theft and tampering. The Cisco Aironet 1130AG Series is ready to install and easy to manage, reducing the cost of deployment and ongoing maintenance. For more information, visit

[http://www.cisco.com/en/US/products/ps6087/products\\_data\\_sheet0900aecd801b9058.html](http://www.cisco.com/en/US/products/ps6087/products_data_sheet0900aecd801b9058.html).

### **Cisco Aironet 1100 Series Access Point**

Offers customers an affordable, easy-to-install, 802.11g single-band access point that features enterprise-class management, security, and scalability. The device is available in either a lightweight version or an autonomous version that may be field-upgraded to lightweight operation. For more information, visit

[http://www.cisco.com/en/US/products/hw/wireless/ps4570/products\\_data\\_sheet09186a00800f9ea7.html](http://www.cisco.com/en/US/products/hw/wireless/ps4570/products_data_sheet09186a00800f9ea7.html)

### **Indoor Access Points for Challenging RF Environments**

#### **Cisco Aironet 1250 Series IEEE 802.11n draft 2.0 Access Point**

The Cisco® Aironet® 1250 Series is the first enterprise-class access point to support the IEEE 802.11n draft 2.0 standard. 802.11n offers combined data rates of up to 600 Mbps to provide users with mobile access to high-bandwidth data, voice, and video applications regardless of their location. Through the use of multiple-input multiple-output (MIMO) technology, 802.11n also provides reliable and predictable WLAN coverage to improve the end-user experience for both existing 802.11a/b/g clients and new 802.11n clients. The robust Cisco Aironet® 1250 Series Access Point is a modular platform designed to be easily field-upgradeable to support a variety of wireless capabilities. This modularity allows businesses to deploy existing wireless technologies today with the confidence that their network investment will extend to support emerging and future wireless technologies.

#### **Cisco Aironet 1240AG Series IEEE 802.11a/b/g Access Point**

Delivers the versatility, high capacity, security, and enterprise-class features required in more challenging RF environments, such as warehouses, factories, and retailers. The device is available in either a lightweight or an autonomous version that may be field-upgraded to lightweight operation. With support for both lightweight and autonomous operation, customers can enjoy the simplicity and efficiency of having a common hardware platform even while having a hybrid lightweight and autonomous deployment. Designed for wireless LANs in rugged environments or installations that require specialized external antennas, the Cisco Aironet 1240AG Series features diversity antenna connectors for both 2.4 and 5 GHz bands to provide extended range, coverage versatility, and more flexible installation options. The Cisco Aironet 1240AG Series Access points combines this versatility with industry-leading transmit power, receive sensitivity, and delay spread for high-multipath environments, providing reliable performance and throughput under the most demanding conditions. A second-generation dual-band access point, the Cisco Aironet 1240AG Series supports IEEE 802.3af Power over Ethernet (PoE). The product comes complete with all necessary mounting hardware to provide for an installation that is both secure and rugged. The mounting bracket locks the access point as well as the Ethernet and console cables in place to prevent theft and tampering. For more information, visit

[http://www.cisco.com/en/US/products/ps6521/products\\_data\\_sheet0900aec8031c844.html](http://www.cisco.com/en/US/products/ps6521/products_data_sheet0900aec8031c844.html).

#### **Cisco Aironet 1200 Series Access Point**

Offers the same versatility, high capacity, security, and enterprise-class features demanded by industrial wireless LAN customers in a single-band 802.11g solution. The modular device provides the flexibility to field-upgrade to a dual-band 802.11a/g network by adding a CardBus-based 802.11a upgrade module that can be easily installed in Cisco Aironet 1200 Series access points that were originally configured for 802.11g. For more information, visit

[http://www.cisco.com/en/US/products/hw/wireless/ps430/products\\_data\\_sheet09186a00800937a6.html](http://www.cisco.com/en/US/products/hw/wireless/ps430/products_data_sheet09186a00800937a6.html).

### Cisco Aironet 1230AG Series Access Point

The Cisco Aironet 1230AG Series is a preconfigured dual-band version of the 1200 Series, providing support for 802.11a and 802.11g. This first-generation, dual-band device does not, however, provide the same performance and support for 802.3af PoE as does the 1240AG Series. For more information, visit

[http://www.cisco.com/en/US/products/ps6108/products\\_data\\_sheet0900aec801b9068.html](http://www.cisco.com/en/US/products/ps6108/products_data_sheet0900aec801b9068.html).

### Outdoor Access Points and Bridges

#### Cisco Aironet 1300 Series IEEE 802.11g Wireless Outdoor Access Point and Bridge

Provides access point, wireless bridge, and workgroup bridge capabilities with enhanced WLAN security. For high-speed, cost-effective wireless connectivity between multiple fixed or mobile networks and clients, this ruggedized platform is ideal for public access for outdoor areas, network connections within a campus area, or outdoor infrastructures for mobile networks and users. Engineered specifically for harsh outdoor environments, the Cisco Aironet 1300 Series is ideal for WLANs requiring outdoor coverage. The Cisco Aironet 1300 Series is available in either a lightweight version or an autonomous version that may be field-upgraded to lightweight operation.

**Note:** The Cisco Aironet 1300 Series supports LWAPP when operating as an access point. When it operates in bridge mode, however, it does not support the LWAPP protocol.

For more information on the Cisco Aironet 1300 Series Access Points, visit

[http://www.cisco.com/en/US/products/ps5861/products\\_data\\_sheet09186a00802252e1.html](http://www.cisco.com/en/US/products/ps5861/products_data_sheet09186a00802252e1.html).

#### Cisco Aironet 1500 Series Lightweight Outdoor Mesh Access Point

The Cisco Aironet 1500 Series enables cost-effective, scalable deployment of secure outdoor wireless LANs. With dual-band, simultaneous support for IEEE 802.11a and 802.11b/g standards, the Cisco Aironet 1500 Series employs a patent-pending Adaptive Wireless Path Protocol to form a dynamic wireless mesh network between remote access points, and delivers secure wireless access to any Wi-Fi-compliant client.

### Architecture of the Cisco Unified Wireless Network

Cisco Aironet access points are a key component of the Cisco Unified Wireless Network. The Cisco Unified Wireless Network cost-effectively addresses the wireless LAN security, deployment, management, and control issues facing enterprises. This framework integrates and extends wired and wireless networks to deliver scalable, manageable, and secure wireless LANs with the lowest total cost of ownership. It provides the same level of security, scalability, reliability, ease of deployment, and management for wireless LANs that organizations expect from their wired LANs. It includes innovative RF technology capabilities that enable real-time access to core business applications while at the same time delivering enterprise-class, secure connectivity.

With the Cisco Unified Wireless Network, the best elements of wireless and wired networking are combined to bring mobility to the enterprise in a secure and reliable manner. The flexibility of the Cisco Unified Wireless Network allows network managers to design networks to meet their specific needs, whether implementing highly integrated network designs or simple overlay networks.

For more information on the Cisco Unified Wireless Network, visit

## Supporting Products, Partners, and Service Offerings

### Cisco Wireless LAN Controllers

Cisco wireless LAN controllers are part of the Cisco Unified Wireless Network LAN feature set and are responsible for handling systemwide wireless LAN functions across an entire wireless network. Cisco wireless LAN controllers are designed to smoothly integrate into existing enterprise networks. They communicate with Cisco Aironet lightweight access points over any Layer 2 (Ethernet) or Layer 3 (IP) infrastructure using the Lightweight Access Point Protocol (LWAPP). For more information about Cisco wireless LAN controllers, visit [http://www.cisco.com/en/US/products/hw/wireless/products\\_category\\_buyers\\_guide.html#number\\_3](http://www.cisco.com/en/US/products/hw/wireless/products_category_buyers_guide.html#number_3).

### Wireless LAN Management

Network managers need reliable, cost-effective tools for wireless LAN planning, configuration, and management. These tools must be centrally available and support simplified operations and easy-to-use graphical interfaces. Cisco wireless LAN management options are determined based on the type of access points deployed and the features required.

- Lightweight access points may be managed with Cisco wireless LAN controllers and the Cisco Wireless Control System (WCS).

- A Cisco Wireless Location Appliance may be added for advanced features such as wireless voice over IP (VoIP) and location services, as well as advanced wireless security features, such as Network Admission Control (NAC), the Cisco Self-Defending Network, and guest access.
- Autonomous access points may be configured with the CiscoWorks Wireless LAN Solution Engine (WLSE) or CiscoWorks Wireless LAN Solution Engine Express.

#### Cisco Wireless Control System

Cisco Wireless Control System (WCS) is a Windows or Linux server-based platform for wireless LAN planning, configuration, and management. It provides a powerful foundation by which IT managers can design, control, and monitor enterprise wireless networks from a centralized location, simplifying operations and reducing total cost of ownership. For more information about Cisco WCS, visit <http://www.cisco.com/en/US/products/ps6305/index.html>.

#### Cisco Catalyst 3750G Integrated Wireless LAN Controller

The Cisco Catalyst® 3750G Integrated Wireless LAN Controller is a Cisco 4400 Series Wireless LAN controller integrated into the Cisco Catalyst 3750G Switch. The Cisco Catalyst 3750G Integrated Wireless LAN Controller works in conjunction with Cisco Aironet Series lightweight access points, the Cisco Wireless Control System (WCS), and the Cisco Wireless Location Appliance to deliver a secure and unified wireless solution that supports mission-critical wireless data, voice, and video applications. For more information about the Cisco Catalyst 3750G, visit <http://www.cisco.com/en/US/products/ps6915/index.html>.

#### Cisco Catalyst 6500 Series Wireless Services Module (WiSM)

The Cisco WiSM is a member of the Cisco wireless LAN controller family. It works in conjunction with Cisco Aironet lightweight access points, the Cisco Wireless Control System (WCS) and the Cisco Wireless Location Appliance to support mission-critical wireless data, voice, and video applications. It provides real-time communication between lightweight access points and other WLAN controllers to deliver a secure and unified wireless solution. For more information about the Cisco WiSM, visit <http://www.cisco.com/go/wism>.

#### Cisco Wireless LAN Controller Module for Integrated Services Routers (ISR)

The Cisco Wireless LAN Controller Module allows small and medium-sized businesses (SMBs) and enterprise branch offices to cost-effectively deploy and manage secure WLANs. The module provides unparalleled security, mobility, and ease of use for business-critical WLANs, delivering the most secure enterprise-class wireless system available. As a Cisco Integrated Services Router module, it delivers centralized security policies, wireless Intrusion Prevention System (IPS) capabilities, award-winning RF management, quality of service (QoS), and Layer 3 fast secure roaming for WLANs. The Cisco Wireless LAN Controller Module manages up to six Cisco Aironet lightweight access points and is supported on Cisco 2800 and 3800 Series Integrated Services Routers and Cisco 3700 Series Routers.

For more information about the Cisco Wireless LAN Controller Module, visit <http://www.cisco.com/en/US/products/ps6730/index.html>.

#### CiscoWorks Wireless LAN Solution Engine

The CiscoWorks Wireless LAN Solution Engine (WLSE) is available as a management tool for Cisco Aironet autonomous access points and wireless bridges. CiscoWorks WLSE is an easily deployed and scalable management platform for managing hundreds to thousands of Cisco Aironet autonomous access points and wireless bridges. For more information about CiscoWorks WLSE, visit <http://www.cisco.com/go/wlse>.

### **CiscoWorks Wireless LAN Solution Engine (WLSE) Express**

The WLSE Express is a complete wireless LAN management solution with an integrated authentication, authorization, and accounting (AAA) server for small to medium-sized enterprise facilities or branch offices using Cisco Aironet autonomous access points and wireless bridges.

For more information about CiscoWorks WLSE Express, visit

<http://www.cisco.com/en/US/products/ps6379/index.html>.

### **Wireless LAN Location Services**

Cisco Wireless Location Appliance

The Cisco Wireless Location Appliance is the industry's first location solution that simultaneously tracks thousands of devices from directly within the WLAN infrastructure. The Cisco Wireless Location Appliance brings the power of a cost-effective, high-resolution location solution to critical applications such as high-value asset tracking, IT management, and location-based security. This easy-to-deploy solution smoothly integrates with Cisco wireless LAN controllers and Cisco Aironet lightweight access points to track the physical location of wireless devices, including Wi-Fi-enabled laptops, voice handsets, Wi-Fi tags, and rogue devices, to within a few meters. For more

information about the Cisco Wireless Location Appliance, visit

<http://www.cisco.com/en/US/products/ps6386/index.html>.

### **Service and Support**

Cisco offers a wide range of service programs to accelerate customer success. These innovative programs are delivered through a unique combination of people, processes, tools, and partners, resulting in high levels of customer satisfaction. Cisco Services help you protect your network investment, optimize network operations, and prepare your network for new applications to extend network intelligence and the power of your business. For more information about Cisco Services, visit [http://www.cisco.com/en/US/products/svcs/ps2961/ps2738/serv\\_home.html](http://www.cisco.com/en/US/products/svcs/ps2961/ps2738/serv_home.html).
